

Instructional Video Project Reflection

This project was by far the most time consuming one I have undertaken this semester. I have poured many hours into it, and I truly hope it helps people to better understand LEGO Mindstorms NXT.

I feel like I essentially created two projects because I ended up with two separate videos, each over 8 minutes long. Both video required a massive amount of editing and tweaking to meet a standard I had set for them in my head.

I definitely learned a lot about video production with this project because it introduced me to all aspects of it. From planning... to filming... to editing... I have now done it all.

I admit that I probably spent a lot longer working on this project than I should have, and some of my other grades may suffer for it, but I just couldn't help myself.

If I could go back and change something, I would have borrowed a microphone from the studio so all of my voice recordings would be as clear and consistent as possible. For this first time, however, my video editing software thankfully allowed me to increase the volume in areas that needed it.

My procedure paper details most everything else that I may have otherwise mentioned here. Overall, this was a very difficult project to complete. While it was frustrating at times, it is highly rewarding to be able to look back on all of my work and see a final product I am proud of.
